### Testes unitários

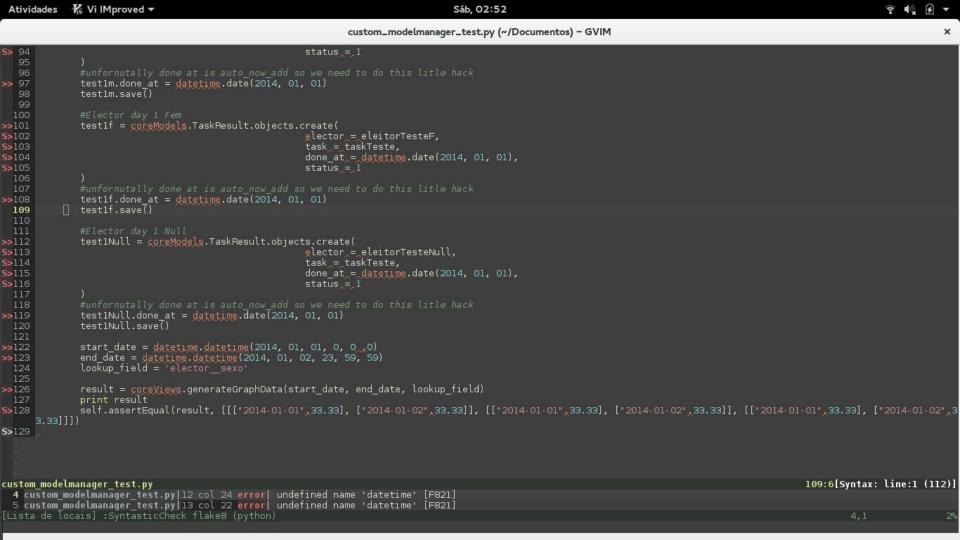

#### Garantia de entrada/saída no teste unitário

```
1 from unittest import TestCase
2 from foo import foo
3
4
5 class FooTestCase(TestCase):
6
7      def test_if_function_return_correct_value(self):
8          self.assertEqual('It has a param!', foo(1))
9          self.assertEqual('Nope!', foo('))
```

- Unittest
- Py.test

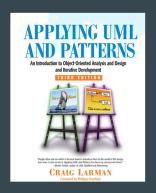

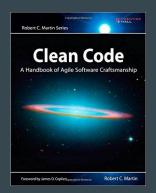

## Padrões de Projeto

- Utilizando UML e Padrões
- Código limpo
- Curso Python Patterns Luciano Ramalho

Indicação de estudo

## Testes unitários como ferramenta de design

```
class FooTestCase(TestCase):

def setUp(self):

inhas: '''

def test calculate_charged_price_correctly(self):
    final_value = self.foo.calculate_charged_price()
    self.assertEqual(1.2, final_value) #without custom tax for product 1

final_value = self.foo.calculate_charged_price(2)

self.assertEqual(4, final_value) #with custom tax for product 1

Tax.objects.delete()

final_value = self.foo.calculate_charged_price()

self.assertEqual(1, final_value) # without custom tax, without tax
```

#### Teste unitariamente o seu código

```
20
21 class FooTestCase(TestCase):
      def setUp(self):
24 +--- 3 linhas: '''-----
27
      def test calculate_charged_price_without_custom_tax(self):
          final value = self.foo.calculate_charged_price()
          self.assertEqual(1.2, final value)
      def test get price raises custom exception(self):.....
          Price.objects.delete()
          self.assertRaises(Price.DoesNotExist, self.foo.calculate charged price, 1)
      def test calculate charged price with custom tax(self):
          final value = self.foo.calculate charged price(2)
          self.assertEqual(4, final value)
      def test calculate charged price without custom tax and tax(self):
          Tax.objects.delete()
          final value = self.foo.calculate_charged_price()
          self.assertEqual(1, final value)
      def test get returns correct active price(self):
```

#### Teste fluxos de sucesso e erro separadamente

```
21 class FooTestCase(TestCase):
       def setUp(self):
       def test calculate charged price without custom tax(self):
           final value = self.foo.calculate charged price()
           self.assertEqual(1.2, final value)
       def test get price raises does not exist if has no price(self):
           Price.objects.delete()
           self.assertRaises(Price.DoesNotExist, self.foo.calculate charged price, 1)
       def test calculate charged price with custom tax(self):
           final_value = self.foo.calculate_charged_price(2)
           self.assertEqual(4, final value)
       def test calculate charged price raise custom exception if custom tax is not a number(self):
           self.assertRaises(InvalidCustomTaxException, self.foo.calculate charged price, 't')
       def test calculate charged price without custom tax and tax(self):
           Tax.objects.delete()
           final value = self.foo.calculate charged price()
           self.assertEqual(1, final value)
       def test get returns correct active price(self):
```

#### Nomeie os testes de acordo com o fluxo testado

```
1 class PatientReport(object):
2
3     def create_report(self, data)
4
5         openned_file = open('/tmp/tmp_file.txt', 'w+')
6         for item in data:
7               openned_file.write('{};{};{};{}\n'.format(*item))
8               openned_file.close()
9
```

```
19 from unittest import TestCase
20 from mock import mock_open, patch
21 from foo import PatientReport
24 class PatientTestCase(TestCase):
        def setUp(self):
            self.report = PatientReport()
        @patch(' builtin .open', mock open())
        def test_if_creates_file_with_correct_permissions(self, mocked_open):
             self.report.create report(self.data)
            mocked open.assert_called once with('/tmp/xpto.csv', 'w')
        Qpatch('__builtin__.open', mock_open())
def test_if_format_data_and_write_in_file_correctly(self, mocked_open):
             self.report.create report(self.data)
            mocked open().write.assert called once with('1; 2; 3; 4\n')
       @patch('__builtin__.open', mock_open())
def test_if_closes_file_correctly(self, mocked_open):
    self.report.create_report(self.data)
42
            self.assertTrue(mocked open.close.called)
```

#### Testes devem ser isolados!

```
def test_view_returns_200(self):
    response = self.client.get(self.url)

self.assert200(response)
    self.assertEqual(PRESENTER_STUB['paciente_id'], response.context['paciente_id'])

for key in response.context['aso']:
    self.assertEqual(PRESENTER_STUB['aso'][key], response.context['aso'][key])

self.assertEqual(PRESENTER_STUB['aso'][key], response.context['aso'][key])
```

```
def test_view_returns_200(self):
    response = self.client.get(self.url)
    self.assert200(response)

def test_view_has_correct_context
    self.assertEqual(PRESENTER_STUB['paciente_id'], response.context['paciente_id'])
    for key in response.context['aso']:
        self.assertEqual(PRESENTER_STUB['aso'][key], response.context['aso'][key])

19
```

#### Testes devem ser pequenos!

#### TestCases também devem ser pequenos!

## TDD

#### Obrigada!
